CSCI935 / CSCI435 COMPUTER VISION · SPRING 2026

Group Project Team Plan

Rice Leaf Disease Classification and Detection for Bangladeshi Local Rice

Work starts
Mon 26 Oct
Plan and links shared Sun 25

Team submission
Thu 29 Oct
Everything finished and submitted

Official deadline
Sun 1 Nov, 11:30pm
Fri 30 Oct to Sun 1 Nov is emergency buffer only

Member	Role in one line
Moinul	Code lead: dataset inspection, all code, experiments, Section 6 Results, submission
Anika	Report lead: literature search, Sections 3, 4, 5, Executive Summary, final report
Amit	Sample images, Paper 1 summary, failure-case review
Akram	Paper 2 summary, report figures, clean-machine test of the User Manual
Sabir	Paper 3 summary, installation instructions
Aziz	Paper 4 summary, IEEE reference list

CONTENTS

1. How to use this document (and how to use AI with it)
2. The project in plain words, and key terms
3. Page limits
4. Ground rules and where files go
5. Calendar
6. Everyone's tasks at a glance
7. The paper summary task (Amit, Akram, Sabir, Aziz)
8. Amit · 9. Akram · 10. Sabir · 11. Aziz · 12. Anika · 13. Moinul

1. How to use this document

1. **Everyone reads Sections 1 to 6** (about 5 pages). They explain the project, the page limits and the rules.
2. **Then read your own chapter** (Sections 8 to 13). It has every task you own, with exact steps, size limits, file names and due dates.
3. **Paper summary writers** (Amit, Akram, Sabir, Aziz) also read **Section 7**.
4. Each task ends with a **"Done when"** checklist. Tick every box before you post that the task is finished.

The plan is fixed

Due dates, size limits, file names and folders in this document are decided. Please don't change them, even if an AI tool suggests something different. If something looks wrong or impossible, ask in the group chat.

Using AI to understand your tasks

You are welcome to use AI tools (ChatGPT, Claude, Gemini, etc.) to understand your tasks, the paper you are summarising, or a term you don't know. To get good answers:

1. **Give the AI the context.** Upload this whole PDF, or copy the "Context for AI" box below plus your own chapter.
2. **Use the ready-made prompt** at the end of your chapter. It tells the AI what you need and what it must not change.
3. **Ask the AI to explain, not to do the task for you.** For example: "Explain what this paper's method does in simple words", "What does a confusion matrix show?", "Check my summary against the 6 questions".

Three AI rules that protect our marks

1. **Write report text in your own words.** The brief treats copied text as plagiarism, and AI text often repeats a paper's own sentences. Use AI to understand, then write it yourself.
2. **Check every number against the actual paper or file.** AI tools sometimes invent accuracy figures, dataset sizes and even whole references. Every number and citation you hand in must be one you have seen in the source yourself.
3. **The AI does not override this plan.** If it suggests a longer summary, more figures, a different file name or a different method, ignore it and follow this document.

Context for AI (copy this into your AI chat first)

```
I am a member of a 6-person university group project for CSCI935 Computer Vision (University of Wollongong). The task: build and evaluate a method that classifies rice leaf photos into 5 diseases (Brown Spot, Leaf Scald, Rice Blast, Rice Tungro, Sheath Blight) using the Dhan-Shomadhan dataset (1106 images, two kinds: white background and field background). Our method: a pretrained ResNet-18 network turns each image into a feature vector and an SVM classifies it; we compare it with a baseline of colour histograms + HOG features + SVM. We test 3 scenarios (white-only, field-only, mixed), each repeated over 5 random train/test splits, reporting mean and standard deviation. The report has strict page limits and anything over the limit is not marked. The plan document I will share with you is fixed: do not change due dates, size limits, file names or the method. Help me UNDERSTAND my task and check my work; do not write report text for me, and never invent numbers or references.
```

2. The project in plain words

A client wants software that looks at a photo of a rice leaf and says which of five diseases it has: **Brown Spot, Leaf Scald, Rice Blast, Rice Tungro or Sheath Blight**. The photos come in two kinds: leaves on a **white background** (clean, easy) and leaves in the **field** (soil, other plants, shadows, harder). We use the **Dhan-Shomadhan** dataset of 1106 images collected in the Dhaka Division of Bangladesh.

We have to deliver two things in one zip file:

- **One Python file** that runs the method and reproduces our results.
- **One PDF report** written as a consulting report for the client, with fixed sections and page limits.

Our method, step by step

1. **Feature extraction:** a neural network called **ResNet-18**, already trained by others on millions of everyday photos, turns each leaf photo into a list of 512 numbers that describes it. We don't train this network; we only use it.
2. **Classification:** an **SVM** (support vector machine), a simple classifier, learns which lists of numbers belong to which disease.
3. **Baseline for comparison:** an older approach using **colour histograms** (how much of each colour is in the image) and **HOG** features (directions of edges), also with an SVM.
4. **Testing:** 3 scenarios (white background only, field only, both mixed). Each one is repeated with **5 different random splits** of the data into training and testing images. We report the **average and standard deviation** of accuracy.

Key terms

Term	Meaning in this project
Scenario	Which test images we use: *white*, *field* or *mixed*.
Split	One random division of the images into a training part (80%) and a testing part (20%). We do 5 splits.
Accuracy	Percentage of test images given the correct disease.
Standard deviation (std)	How much the accuracy changes between the 5 splits. Small std = stable results.
Confusion matrix	A 5 × 5 table: rows are the true disease, columns the predicted disease. It shows which diseases get mixed up.
Failure case	A test image the method classified wrongly.
IEEE style	The citation format the brief requires: `[1]` in the text, full details in the reference list.
IEEE Xplore	The paper database we must use, accessed through the UOW library.
Clean machine	A computer or fresh Python environment that has never run our code, used to check the instructions work.

Report sections (from the assignment brief)

1 Coversheet · 2 Executive Summary · 3 Problem Description · 4 Related Work · 5 Method and Implementation · 6 Experimental Results and Analysis · 7 References · 8 Appendix: User Manual. Page limits for each are in Section 3.

3. Page limits

Anything past a section's page limit is ignored by the marker

Report format: single column, 12pt font, 1.25 cm margins. **One full page is about 450 words.** Figures and tables count toward the page limit of the section they sit in.

Section	Marks	Page limit	Owner
Coversheet	0	1 page	Anika
2. Executive Summary	1	0.5 page	Anika
3. Problem Description	5	1 page	Anika
4. Related Work	2	2 pages (4 summaries x 0.5 page)	Amit, Akram, Sabir, Aziz write; Anika edits
5. Method and Implementation	8	3 pages	Anika (method, 2 pages), Moinul (implementation, 1 page)
6. Experimental Results and Analysis	8	2 pages	Moinul
7. References	1	no limit	Aziz
8. Appendix: User Manual	0 (heavy penalty if wrong)	2 pages	Sabir (install, 1 page), Moinul (run, 1 page)

How we stay inside the limits

1. **Each section starts on a new page** in the report, so checking a limit means counting pages.
2. **Every task has its own size limit** (words, pages or number of images). Stay at or under it.
3. **Figures are full text width and at most 6 cm tall.** Related images are combined into one figure with panels (a), (b), (c).
4. **No figure repeats a table.** If numbers are in a table, they are not also charted.

4. Ground rules and where files go

1. **Own words only.** Copying sentences from a paper, website or AI tool is plagiarism and costs the whole group.
2. **Stay inside your size limit.** If your limit is 200 words, 230 words is not acceptable. Use Word count in Word or Google Docs (Tools > Word count).
3. **Use the exact file name and folder** given in your task.
4. **Post in the group chat when a task is done**, with the file name.
5. **If you will be late, say so before the due date.** Late tasks are reassigned the next day so the group stays on schedule.
6. **Your finished tasks are listed as your contribution** on the report coversheet.

Where files go

Everything goes in our private GitHub repository (link and invite posted in the group chat with this plan). Accept the email invite from GitHub first. The repo already has these folders:

Folder	What goes in it	Who uses it
`papers/`	Paper PDFs and paper summaries	Anika, Amit, Akram, Sabir, Aziz
`dataset-notes/`	Dataset inspection notes	Moinul, Anika
`figures/samples/`	10 sample images for Section 3	Amit, Akram
`figures/failures/`	6 failure-case images	Amit, Akram
`docs/`	Installation instructions, User Manual, clean-machine test	Sabir, Moinul, Akram
`report/`	Report draft and reference list	Anika, Aziz, Moinul

HOW TO UPLOAD A FILE (NO GIT KNOWLEDGE NEEDED)

1. Open the repo link in your browser and sign in to GitHub.
2. Click the folder your task names (for example `papers`).
3. Click **Add file** > **Upload files**, then drag your file in.
4. In the box under "Commit changes", type what it is (for example *Paper 1 summary, Amit*).
5. Leave **Commit directly to the main branch** selected and click **Commit changes**.

To update a file, upload it again with the same name. Never delete or rename other people's files. Do not upload the dataset; it is too large and is ignored by the repo.

The report itself is written in one shared **Google Doc** that Anika sets up (link in the repo's README).

5. Calendar

Date	Who	What is due
Sun 25 Oct	Moinul	Plan shared; GitHub repo link posted and everyone invited
Mon 26 Oct, 12pm	Anika	Papers found and assigned; report template
Mon 26 Oct	Amit	A1 Sample images
Mon 26 Oct	Moinul	Dataset inspection; baseline running; first results shared for Akram (evening)
Tue 27 Oct, 12pm	Sabir	S2 Installation instructions
Tue 27 Oct	**Amit, Akram, Sabir, Aziz**	**Paper summaries (200 words each)**
Tue 27 Oct	Akram	K2 Figures script
Tue 27 Oct	Anika	Section 3 Problem Description; Section 5 Method part
Tue 27 Oct	Moinul	All experiments finished; implementation part; wrong-prediction list for Amit; User Manual ready for Akram (evening)
Wed 28 Oct, 12pm	Amit	A3 Failure-case review
Wed 28 Oct, 12pm	Aziz	Z2 Reference list
Wed 28 Oct	Akram	K4 Clean-machine test (by 12pm); K3 Final figures (evening)
Wed 28 Oct	Anika	Section 4 Related Work
Wed 28 Oct	Moinul	Fix test issues; Section 6 complete
Thu 29 Oct	Moinul, Anika	Code freeze; Section 6 reviewed; Executive Summary, coversheet, final merge
Thu 29 Oct	**Moinul**	**Submit on Moodle**
Fri 30 Oct to Sun 1 Nov		**Emergency buffer. No planned work.**

6. Everyone's tasks at a glance

Member	Task	Size limit	Due
Amit	A1 Sample images	10 images	Mon 26 Oct
	A2 Summary of Paper 1	200 words (0.5 page)	Tue 27 Oct
	A3 Failure-case review	6 images, 15 words each	Wed 28 Oct, 12pm
Akram	K1 Summary of Paper 2	200 words (0.5 page)	Tue 27 Oct
	K2 Figures script	3 figures, max 6 cm tall	Tue 27 Oct
	K4 Clean-machine test	Test log	Wed 28 Oct, 12pm
	K3 Final figures	3 figures, max 6 cm tall	Wed 28 Oct (evening)
Sabir	S1 Summary of Paper 3	200 words (0.5 page)	Tue 27 Oct
	S2 Installation instructions	1 page	Tue 27 Oct, 12pm
Aziz	Z1 Summary of Paper 4	200 words (0.5 page)	Tue 27 Oct
	Z2 Reference list	No limit	Wed 28 Oct, 12pm
Anika	See Section 12		
Moinul	See Section 13		

7. The paper summary task

Who	Amit = Paper 1 · Akram = Paper 2 · Sabir = Paper 3 · Aziz = Paper 4
Due	Tue 27 Oct
Size limit	200 words maximum (half a page). One paragraph. No headings, no bullet points, no figures.
Input	Your paper PDF, which Anika puts in `papers/` by Mon 26 Oct, 12pm
Hand in	`papers/paper<N>_summary_<yourname>.docx` , for example `papers/paper1_summary_amit.docx`

WHY THIS TASK MATTERS

Section 4 of the report must summarise at least 4 IEEE papers from 2022 or later, and it has **only 2 pages**. Four summaries of half a page each fill it exactly. If a summary is longer, the end of the section is not marked.

> **You do not search for papers**
>
> Anika finds them. By **Mon 26 Oct, 12pm** she puts the PDFs in `papers/` as `paper1.pdf` to `paper4.pdf` and posts in the group chat who has which. Nothing to do before then.

STEPS

1. **Read** the paper's abstract, method section, results section and conclusion. You don't need every page.
2. **Answer these 6 questions** in rough notes:
   a. What problem did they solve, on what data? (how many images, which crop, field or lab photos)
   b. What method did they use? (which features or which model)
   c. What was their main result? (one number, for example "96% accuracy on 4 diseases")
   d. What is one real strength of the approach?
   e. What is one real limitation? (for example: only clean backgrounds, small dataset, slow)
   f. What does it mean for **our** problem? (white vs field backgrounds, our 5 rice diseases)
3. **Write one paragraph** answering all 6 questions in that order. Use this skeleton:

   > *[Author surname] et al. [N] addressed [problem] using [dataset: size, crop, field or lab photos]. They [method, in 1 to 2 sentences]. They reported [main result with a number]. A strength of this approach is [strength]. However, [limitation]. For our problem, this suggests [relevance to white vs field backgrounds or our 5 diseases].*

   Replace `[N]` with your paper number (Paper 1 = [1]). Anika corrects numbering later.
4. **Be concrete.** Use names and numbers from the paper.

Too vague (avoid)	Concrete (do this)
"The method performed well."	"The method reached 94.2% accuracy on 3,355 images."
"They used deep learning."	"They fine-tuned an EfficientNet-B0 network."
"It has some limitations."	"It was only tested on leaves photographed against a plain background."

   (The numbers in this table are examples only. Use your paper's real numbers.)
5. **Count the words.** 200 maximum.
6. **Below the paragraph**, paste the paper's IEEE citation: on the paper's IEEE Xplore page click **Cite This**, choose **IEEE**, copy. This line does not count toward the 200 words.

DONE WHEN

- ☐ One paragraph, 200 words or fewer
- ☐ All 6 questions answered, in order
- ☐ At least 2 numbers taken from the paper, each checked against the PDF yourself
- ☐ No sentence copied from the paper or from an AI tool
- ☐ IEEE citation pasted underneath
- ☐ Saved with the correct file name in `papers/`, posted in the group chat

Prompt for your AI tool (attach the paper PDF and this plan)

```
I need to write a 200-word summary of the attached paper for Section 4 (Related Work) of our
group report. Please follow Section 7 of the attached plan. First, explain the paper to me
in simple words. Then answer the 6 questions in Section 7 step 2 as short notes, quoting the
page where each number appears so I can check it. Do NOT write the summary paragraph for me.
After I write my own paragraph, I will paste it back: then check it against the 6 questions,
the 200-word limit and the "Done when" list, and point out anything vague.
```

8. Amit

3 tasks · A1 Mon 26 · A2 Tue 27 · A3 Wed 28

A1. Sample images

Due	Mon 26 Oct
Size limit	10 images
Hand in	`figures/samples/` : 10 images + `originals.txt`

WHY

Section 3 shows one example of each disease on each background, in one figure that Akram builds from your images.

STEPS

1. Download the dataset from the link on the assignment's Moodle page and unzip it. **Do not move, rename or edit any file inside it.**
2. Pick **10 images**: for each of the 5 diseases, 1 white-background and 1 field image. Choose images where the disease is **clearly visible**.
3. **Copy** them (never move the originals) and rename the copies exactly:
   `brownspot_white.jpg` `brownspot_field.jpg` `leafscald_white.jpg` `leafscald_field.jpg` `riceblast_white.jpg` `riceblast_field.jpg` `tungro_white.jpg` `tungro_field.jpg` `sheathblight_white.jpg` `sheathblight_field.jpg`
4. In `originals.txt`, write each new name next to the original file name, one per line. Example:
   `brownspot_white.jpg = BS_W_017.jpg`

DONE WHEN

☐ 10 images, all 5 diseases x 2 backgrounds, named exactly as above
☐ `originals.txt` lists all 10 original names

A2. Summary of Paper 1

Due	Tue 27 Oct
Size limit	200 words
Instructions	Follow Section 7 exactly

A3. Failure-case review

Due	Wed 28 Oct, 12pm
Size limit	6 images, one line of 15 words or fewer each, plus one pattern line of 25 words or fewer
Input	`wrong_predictions.csv` from Moinul on Tue 27 Oct (evening) (columns: file name, background, true disease, predicted disease)
Hand in	`figures/failures/` : 6 images + `failures.txt`

WHY

Section 6 must explain when and why the method gets things wrong. It has only 2 pages, so every word counts.

STEPS

1. Open the images listed in `wrong_predictions.csv`.
2. Pick **6**: **3 white-background and 3 field**. Prefer ones where you can see a likely reason for the mistake.

3. Copy the 6 images into `figures/failures/` (keep their original names).
4. In `failures.txt`, write one line per image: `file name | true | predicted | reason (15 words max)`. Example reasons: "Small dark spots look like Brown Spot", "Most of the frame is soil", "Photo is blurred".
5. Add one last line (25 words max) with any pattern you notice, for example "4 of 6 mistakes confuse Rice Blast with Brown Spot".

DONE WHEN

☐ 6 images: 3 white, 3 field

☐ 6 lines, each reason 15 words or fewer

☐ 1 pattern line, 25 words or fewer

Prompt for your AI tool (attach this plan)

```
I am Amit. My tasks are in Section 8 of the attached plan (A1 to A3), and A2 follows Section 7. Explain each of my tasks in simple words, tell me what I should do first, and what a good result looks like. Do not change any due date, size limit or file name. When I paste my work back, check it against the "Done when" list for that task. Do not write the reasons or summary for me.
```

9. Akram

4 tasks · K1 Tue 27 · K2 Tue 27 · K4 Wed 28 · K3 Wed 28

K1. Summary of Paper 2

Due	Tue 27 Oct
Size limit	200 words
Instructions	Follow Section 7 exactly

K2. Figures script

Due	Tue 27 Oct
Size limit	3 figures, each 18 cm wide (full text width) and at most 6 cm tall
Input	First real results from Moinul in the GitHub repo's `results/` folder on Mon 26 Oct (evening); Amit's 10 images in `figures/samples/`
Hand in	`plots.py` as a GitHub pull request, plus the 3 test PNGs posted in the group chat

WHY

The report needs 3 compact figures. Section 6 has only 2 pages, so each figure must be small and readable. Your script is kept separate from the experiment code; Moinul merges it into the main file afterwards.

INPUT FILE YOU WILL READ

`results/confusion_resnet18_svm_<scenario>.csv`, where scenario is `white`, `field` or `mixed`. Each is a 5 x 5 table of counts: rows = true disease, columns = predicted disease, in this order: Brown Spot, Leaf Scald, Rice Blast, Rice Tungro, Sheath Blight. Full details are in `results/README.md` in the repo.

STEPS

Write `plots.py` using **matplotlib only** (plus numpy and the standard library). It has these 3 functions. Each saves a 300 dpi PNG to `results/figures/`:

1. `plot_confusion_matrices(results_dir)` saves `confusion.png`
   - ONE figure with **3 panels side by side**: (a) White, (b) Field, (c) Mixed
   - Disease names on both axes, the count written inside each cell, **one shared colour bar**
2. `plot_sample_grid(samples_dir)` saves `samples.png`
   - ONE figure, **2 rows x 5 columns**: top row white background, bottom row field
   - Disease name above each column; row labels "White" and "Field" on the left
3. `plot_failures(failures_dir, wrong_predictions_csv)` saves `failures.png`
   - ONE strip of 6 images: 3 white, then 3 field
   - Under each image: `true: X / pred: Y`
   - Build and test it now with any 6 images; the real ones arrive Wed 28

RULES

- No numbers typed in by hand. Everything is read from the files.
- Text at least 9pt when printed at 18 cm width.
- No chart titles (the report caption does that).
- Accuracy is reported in a table by Moinul, so **no accuracy bar chart**.

DONE WHEN

☐ All 3 functions run without errors on Moinul's first results and Amit's samples

☐ Each PNG is 18 cm wide and 6 cm tall or less

☐ Pull request opened, test PNGs posted in the group chat

K4. Clean-machine test of the User Manual

Due	Wed 28 Oct, 12pm
Input	`docs/user_manual.docx` from Moinul on Tue 27 Oct (evening)
Hand in	`docs/clean_machine_test.docx`

WHY

If the marker cannot run our code, our results count as not reproducible and we lose heavy marks. You act as the marker.

STEPS

1. Use a computer, or a brand new Python virtual environment, that has **never** run our code.
2. Follow the User Manual **exactly as written**. Do not fix problems using your own knowledge; the marker won't either.
3. For every numbered step, record in a table: **step number · pass or fail · exact error message if it failed**.
4. Record the total run time.
5. Post the result in the group chat on the same day, so Moinul can fix problems the same day.

DONE WHEN

☐ Every step of the manual tested and logged
☐ Every error copied exactly, total run time recorded

K3. Final figures

Due	Wed 28 Oct (evening)
Size limit	Same 3 figures, at most 6 cm tall each
Hand in	`results/figures/confusion.png`, `samples.png`, `failures.png`, posted in the group chat

STEPS

1. Run `plots.py` on Moinul's full results (ready Tue 27) and Amit's failure images (ready Wed 28, 12pm).
2. Place each PNG in a Word page at 18 cm width and print it, or print to PDF at 100%.
3. Check: every label readable, nothing overlapping, nothing cut off, colour bar visible.

Prompt for your AI tool (attach this plan)

```
I am Akram. My tasks are in Section 9 of the attached plan (K1 to K4), and K1 follows
Section 7. Explain each task in simple words and what a good result looks like. For K2, help
me understand matplotlib subplots, shared colour bars and how to size a figure in
centimetres, and help me debug my own code from error messages. Keep to the rules in K2
(matplotlib only, 3 functions with the given names, max 6 cm tall, no accuracy chart). Do
not change any due date, size limit or file name.
```

10. Sabir

2 tasks · S1 Tue 27 · S2 Tue 27 (12pm)

S1. Summary of Paper 3

Due	Tue 27 Oct
Size limit	200 words
Instructions	Follow Section 7 exactly

S2. Installation instructions

Due	Tue 27 Oct, 12pm
Size limit	1 page (the whole User Manual is limited to 2 pages; Moinul writes the other page)
Input	`requirements.txt` in the GitHub repo
Hand in	`docs/install_instructions.docx`

WHY

The report appendix must explain exactly how to install everything. If a step is missing, the marker cannot run our code and we lose heavy marks.

STEPS

1. Install **Python 3.12** from python.org if you don't have it. Note the exact download page.
2. Create a fresh virtual environment and activate it:

	Mac	Windows
Create	`python3.12 -m venv venv`	`py -3.12 -m venv venv`
Activate	`source venv/bin/activate`	`venv\Scripts\activate`

3. Download `requirements.txt` from the GitHub repo and run `pip install -r requirements.txt`
4. Run `pip freeze` and write down the **exact version** of these 7 packages: numpy, matplotlib, opencv-contrib-python, scikit-learn, scikit-image, torch, torchvision.
5. Find out where the ResNet-18 weights are saved when they download for the first time (search "torch hub cache directory"). Write down that folder for Mac and for Windows.
6. Write the instructions as **numbered steps, one command per step**, with Mac and Windows commands side by side in a table. **No screenshots.**
7. Add a **"Common problems"** list, 3 items maximum, for anything that went wrong for you and how you fixed it.

DONE WHEN

☐ Someone who has never used Python could follow it
☐ All 7 package versions listed
☐ Weight download folder given for Mac and Windows
☐ Fits on 1 page

Prompt for your AI tool (attach this plan)

```
I am Sabir. My tasks are in Section 10 of the attached plan (S1 and S2), and S1 follows
Section 7. Explain each task in simple words. For S2, explain what a virtual environment is
and help me fix any installation errors I paste in. The instructions must be written by me,
fit on 1 page, list the exact package versions I get from pip freeze (do not guess
versions), and contain no screenshots. Do not change any due date, size limit or file name.
```

11. Aziz

2 tasks · Z1 Tue 27 · Z2 Wed 28 (12pm)

Z1. Summary of Paper 4

Due	Tue 27 Oct
Size limit	200 words
Instructions	Follow Section 7 exactly

Z2. Reference list in IEEE style

Due	Wed 28 Oct, 12pm
Size limit	No limit
Input	The 4 paper PDFs in `papers/`, plus extra items Anika posts in the group chat (for example the dataset paper and the ResNet paper)
Hand in	`report/references.docx`

WHY

References are worth 1 mark and must follow IEEE style exactly, as shown in Section 7 of the assignment brief.

STEPS

1. Collect every item to be referenced (the 4 papers and Anika's extra items).
2. Get each paper's details from its IEEE Xplore page (**Cite This** > **IEEE**), then make sure it matches these patterns from the brief:

Type	Pattern
Conference paper	A. Author, B. Author, and C. Author, "Title of paper," in *Proceedings of Name of Conference*, Year, pp. xx-yy.
Journal paper	A. Author and B. Author, "Title of paper," *Journal Name*, vol. x, pp. xx-yy, Year.

3. Check every reference against these 5 points:
   a. Author initials come **before** surnames (D. G. Bailey, not Bailey D.)
   b. Paper title in double quotes, with a comma inside the closing quote
   c. Conference or journal name included
   d. Year included
   e. Page numbers included (if the paper has them)
4. List the references in any order. Anika numbers them to match the order they appear in the report.

DONE WHEN

☐ Every paper and extra item listed
☐ Every reference checked against all 5 points
☐ Every detail copied from the real source, not typed from memory or AI

Prompt for your AI tool (attach this plan)

```
I am Aziz. My tasks are in Section 11 of the attached plan (Z1 and Z2), and Z1 follows
Section 7. Explain each task in simple words. For Z2, explain IEEE reference style and check
the references I paste against the 5 points in Z2 step 3. Do not add, invent or complete any
reference details yourself: if something is missing, tell me what is missing so I can find
it in the paper. Do not change any due date, size limit or file name.
```

12. Anika (report lead)

Report sections 2 to 5, final report

Due	Task	Size limit	Details
Mon 26 Oct, 12pm	Literature search	n/a	Find 6 IEEE Xplore papers (2022 or later) on rice or leaf disease classification from images. Upload as `papers/paper1.pdf` to `paper6.pdf`. Assign Papers 1 to 4 in the group chat (Amit 1, Akram 2, Sabir 3, Aziz 4). Papers 5 and 6 are spares
Mon 26 Oct	Report template	n/a	Google Doc (link added to the repo README) with all 8 section headings, **each section starting on a new page**, 12pt font, 1.25 cm margins, page numbers starting from 1 after the coversheet
Tue 27 Oct	Section 3 Problem Description	1 page	About 330 words plus the sample-image figure. Uses Moinul's dataset inspection (ready Mon 26). Frames the task as image classification and argues for the method
Tue 27 Oct	Section 5 Method part	2 pages	Rationale for the method, block diagram, step-by-step algorithm in pseudocode
Wed 28 Oct	Section 4 Related Work	2 pages	Edit the 4 summaries for consistent style; fix citation numbers. If a summary is missing or below standard, write one from Paper 5 or 6
Thu 29 Oct	Review Section 6	n/a	Check it against the brief's 6.1, 6.2 and 6.3 requirements
Thu 29 Oct	Executive Summary, coversheet, formatting	0.5 page	Summary of about 220 words covering Sections 3 to 6. Coversheet lists each member's finished tasks. Check every section is within its page limit

13. Moinul (code lead)

All code, Section 6, submission

Due	Task	Size limit	Details
Sun 25 Oct	Setup	n/a	Share this plan; create the private GitHub repo, invite everyone and post the link; download the dataset and check its folder structure
Mon 26 Oct	Dataset inspection, baseline, main method on one split	1 page	Image counts per disease and background, image sizes, 6 notes on what makes the images hard, uploaded to `dataset-notes/` for Anika. Data loading, 5 seeded stratified splits, colour + HOG + SVM, then ResNet-18 features + SVM on one split; first results in `results/` for Akram (evening)
Tue 27 Oct	All experiments, implementation part, wrong-prediction list, User Manual	1 page each	2 methods x 3 scenarios x 5 splits. Implementation described in modules and pseudocode (no Python code in the report). `wrong_predictions.csv` for Amit. Merge Akram's `plots.py`. Combine run steps with Sabir's install page into `docs/user_manual.docx` for Akram's test (evening)
Wed 28 Oct	Fix test issues, Section 6	2 pages	Fix anything Akram's clean-machine test found. Settings table; results table (mean and std); 6.3 discussion using Amit's failure cases and Akram's figures

Thu 29 Oct	Code freeze, final merge		With Anika
Thu 29 Oct	**Submit on Moodle**		Zip containing only the `.py` file and the `.pdf` report (no images, no interim data)

> **Questions?**
> Ask in the group chat. If a task is unclear, ask on the day you receive it, not on the due date.
